

# UVC Ultraviolet C Light Kits for overhead HA1000-XLR

**HAMILTON  
DRIVE-UP**

## How It Works

Ultraviolet C light is a short-wavelength light that can kill microorganisms by disrupting their DNA, making them incapable of reproduction and harmless. UVC light decontamination devices use high output UVC lamps to emit a constant dosage of UVC light. The UVC light in decontamination devices is created by using a germicidal lamp, which is similar to a fluorescent overhead light.

Kit# XLR-UVC LED

UVC light disinfection has become a popular and effective way to decrease the transmission of bacteria, viruses and other pathogens in institutional and commercial facilities.
