

## CAT5 Cable Tester

### Hamilton Part Number E10059

CAT5 type cable with RJ-45 type connectors is becoming more common throughout the Hamilton line of equipment. The pneumatic tube, audio, entrance control, camera, video recording and alarm systems can all possibly have devices requiring CAT5 type of cable with RJ-45 connectors.

Hamilton has available a new tool to make using this type of cable easier. A CAT5 cable tester, part number E10059, is now available from Hamilton to check the cable and its connectors before connecting the cable to the equipment. Testing before connection to the equipment can prevent damage to devices and ensures proper operation after connection.

The CAT5 cable is simply plugged into the test units to verify there are no opens, shorts, or miswires in the cable assembly. Both ends of the cable must be connected for testing, so the tester can be separated to allow testing of cable already installed. The master and remote sections of the tester separate and the master end will show, with four green LED lights, if the pairs of wires are connected properly.
